## Pitchboard:

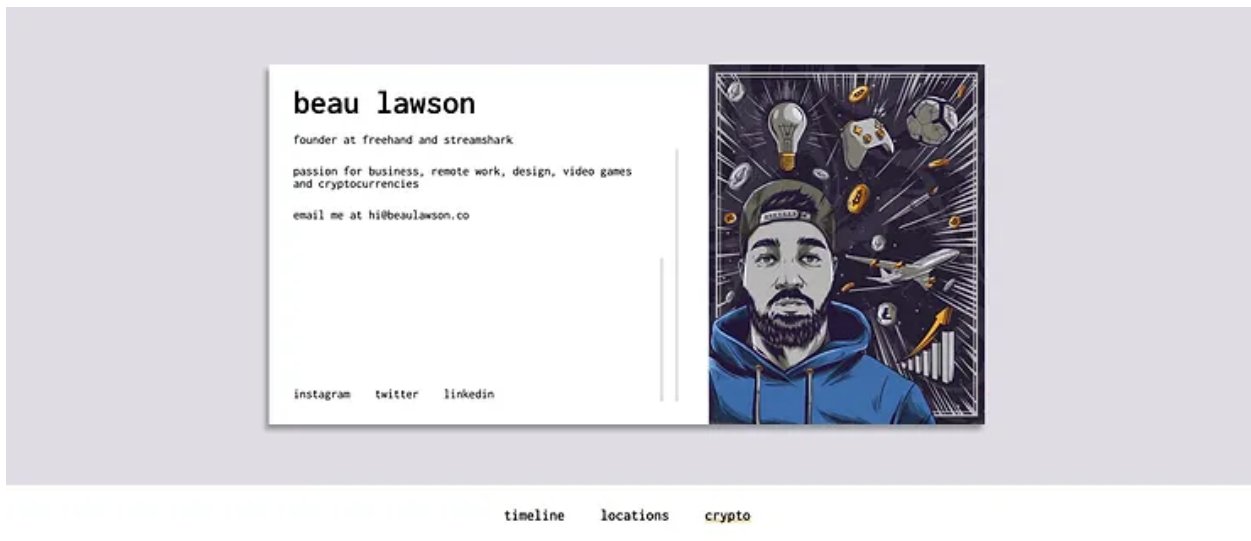

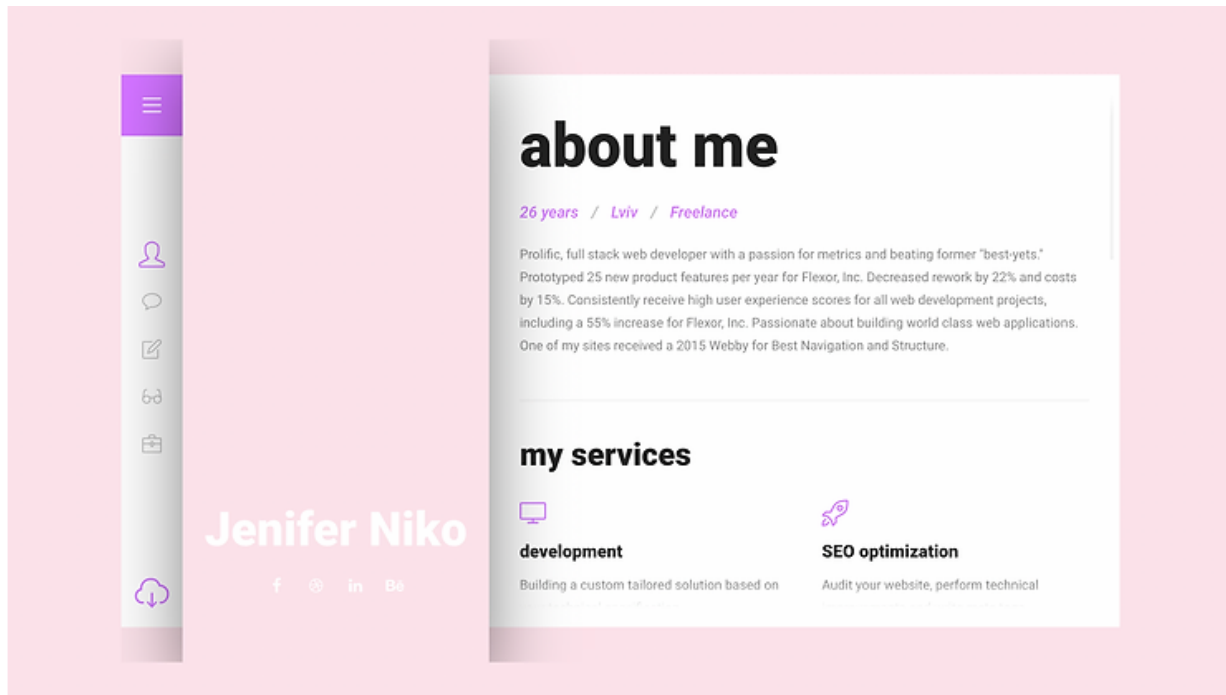

For my final project, I'd like to build my resume through HTML and CSS. I plan on achieving this by demonstrating my skills and experience through images and text, and to include a "Contact Me" page for employers interested in hiring me. The content on the page will be simple and easily digestible, but with pleasing aesthetics to capture the audience's attention.

## Personas:

A typical user who would be accessing my page are employers and hiring managers, who often look for those going above and beyond to prove themselves. Employers typically do not spend long looking at a resume, so it is important to impress quickly. A different type of user who may be visiting my page are high school and college students as they prepare themselves for the professional world. They may spend longer analyzing certain aspects of the page and view it as an example resume.

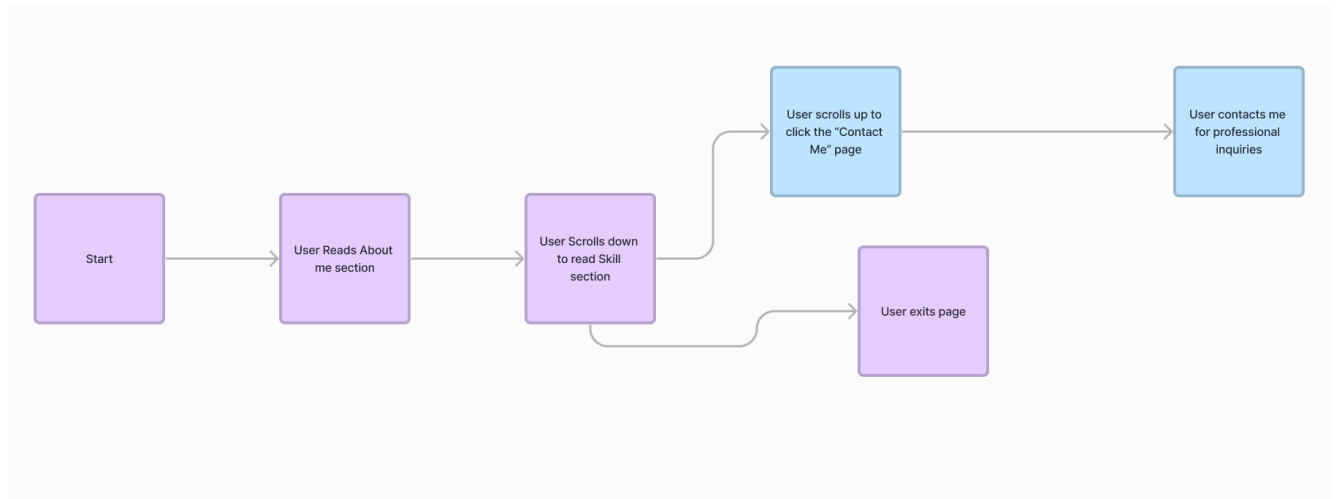

Comps: As I was researching examples of what resume websites could look like, I found a few examples which encapsulated the style I wanted to bring to my project. Both of the following websites are real resume websites for individuals I found from Wixfresh.com. The website from Jenifer Niko highlighted a good way I could display my skills to the reader, using graphics and a

flexbox layout. Beau Lawson's website caught my interest due to the simplicity yet effectiveness it had.

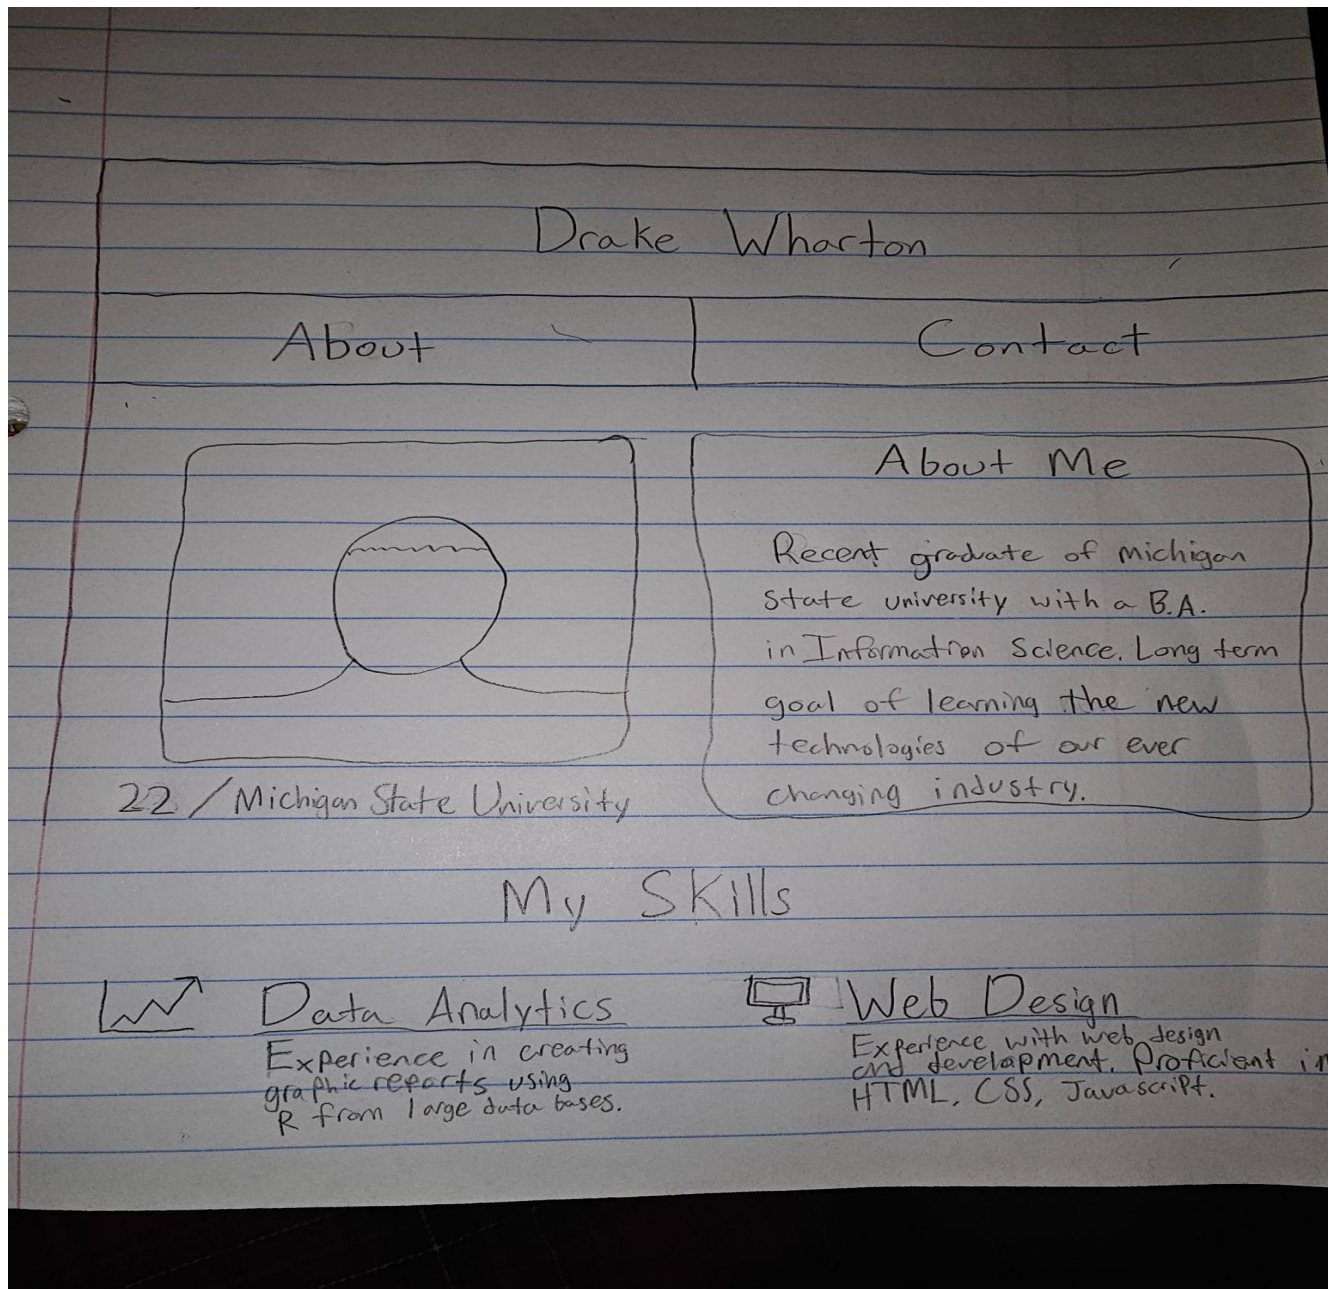

## Flows, Wireframes and Comps:

Flow:

This flowchart demonstrates the most common interaction users will have with my site; reading my resume and deciding whether to reach out to me or not.
